Deploy an App with Docker

Courage Dei

Introducing Today's Project!

What is Docker?

Docker is... and it is useful because... I used Docker in this project to

One thing I didn't expect...

One thing I didn't expect in this project was how easy it was to understand the use of docker and Beanstalk

This project took me...

This project took me approximately an hour The most challenging part was figuring how to complet the project using the less steps, It was most rewarding to see my devops portfolio accessible via a different device on the web.

Understanding Containers and Docker

Containers

Containers are units for packaging all the needed resources of an application. They are useful because they help your application to run on wherever you need it to.

A container image is a template for creating containers.

Docker

Docker is a tool used for creating and managing containers. Docker Desktop is the software that enables you to use Docker easily.

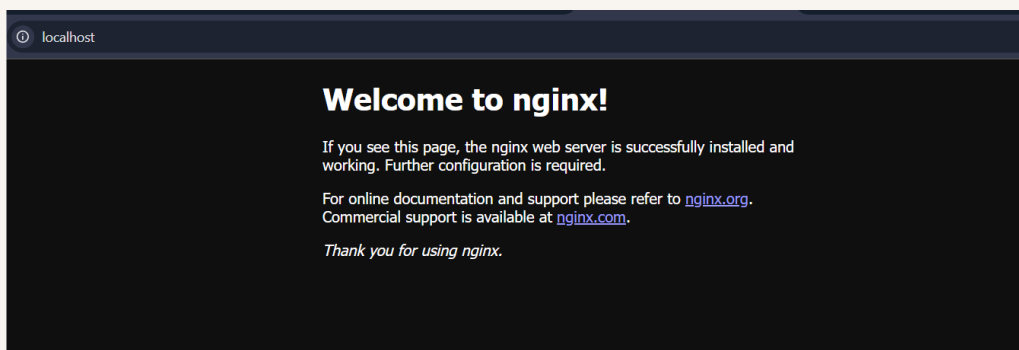

The Docker daemon is the engine that actually does the thing when you run Docker commands e.g. create a container.

Running an Nginx Image

Nginx is a web server

The command I ran to start a new container was docker run

Creating a Custom Image

The Dockerfile is a document that contains all the necessary details of the docker image.

My Dockerfile tells Docker three things the previous docker image we are copying from, the index.html file saved there and the port to run on

The command I used to build a custom image with my Dockerfile was `New-Item -Path . -Name Dockerfile -ItemType File`, The `!!` at the end of the command means in the current directory.

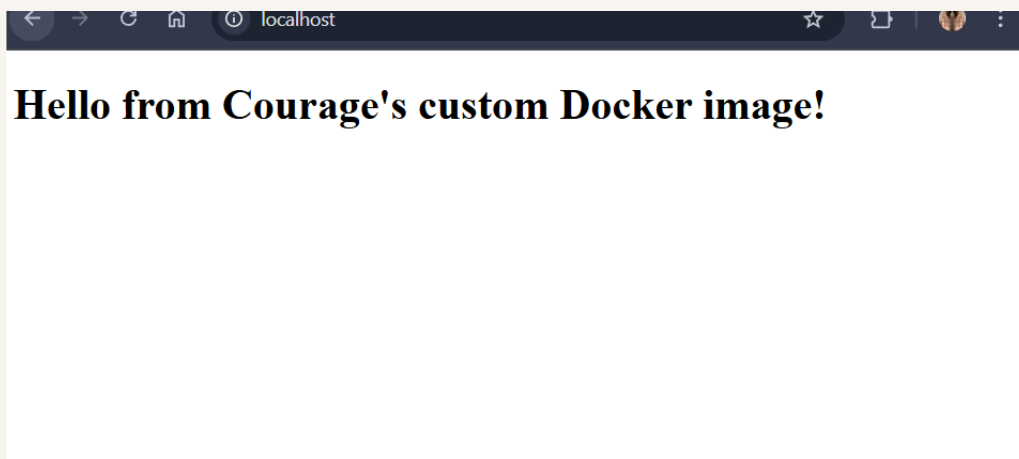

```
FROM nginx:latest
COPY index.html /usr/share/nginx/html/
EXPOSE 80
```

Running My Custom Image

I didn't run into any errors because I had no images running

In this example, the container image is the blueprint containing the code, dependencies that should go into the container and the container is the web app that I need to Display

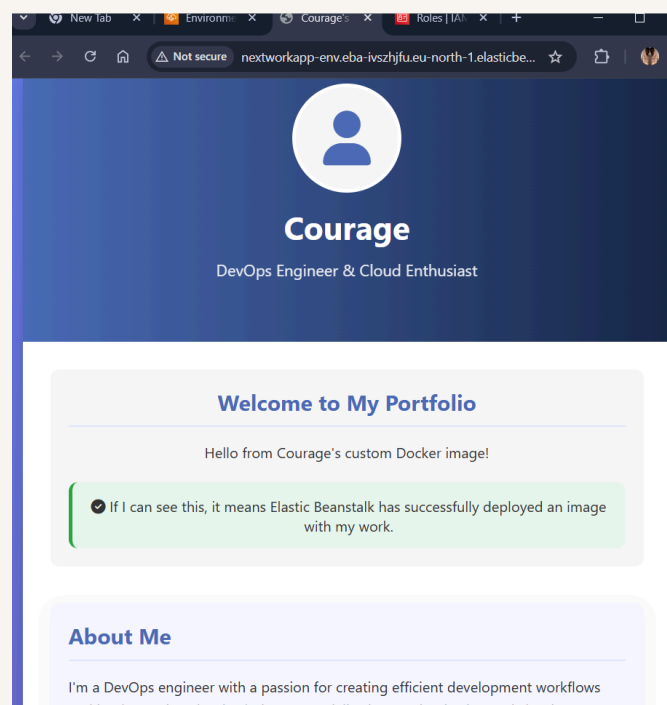

Elastic Beanstalk

Elastic Beanstalk is a cloud service that helps you deploy applications without worrying about the underlining infrastructure needed to run the application.

Deploying my custom image with Elastic Beanstalk took me about an Hour which was really amazing learning to use docker and beanstalk.
